HiveSpace Coworking Event Registration System

1. Project Overview

HiveSpace is a Laravel-based coworking event registration system. It allows visitors to view upcoming events and register using their name and email. Administrators can create, edit, and delete events through the admin area.

2. Technology Stack

- Laravel 13
- PHP 8.5
- MySQL 8.4
- Docker / Laravel Sail
- HTML, CSS, Blade
- Git & GitHub
- Railway for deployment

3. Main Features

Public Website

- View upcoming events
- View event details
- Register for an event
- Receive a registration confirmation message

Admin Area

- View all events
- Add new events
- Edit existing events
- Delete events

4. Important URLs

Live Website:

<https://hivespace-event-portal-production.up.railway.app>

Admin Events:

<https://hivespace-event-portal-production.up.railway.app/admin/events>

Create Event:

<https://hivespace-event-portal-production.up.railway.app/admin/events/create>

Public Event/ Home page

<https://hivespace-event-portal-production.up.railway.app/>

Event Registration:

/events/{event-id}

5. Local Setup

Clone the repository and enter the project directory:

```
git clone https://github.com/ahmedwajid017-pixel/hivespace-event-portal.git
cd hivespace-event-portal
```

Install dependencies:

```
composer install
npm install
```

Copy the environment file:

```
cp .env.example .env
```

Configure the MySQL database in `.env`, then generate the application key:

```
php artisan key:generate
```

Run migrations and seed sample events:

```
php artisan migrate --seed
```

For the Docker/Sail environment:

```
docker compose up -d
```

6. Database

The main database tables are:

- `events` — stores event information
- `ticket_types` — stores event ticket types

- registrations — stores visitor registrations
- users — Laravel user table
- sessions — application sessions

Database migrations are located in:

```
database/migrations/
```

7. Deployment

The project is deployed on Railway using a Dockerfile and Railway configuration.

Production database settings are provided through Railway environment variables. Important variables include:

```
APP_ENV=production
APP_DEBUG=false
APP_KEY=...
DB_CONNECTION=mysql
DB_HOST=...
DB_PORT=...
DB_DATABASE=...
DB_USERNAME=...
DB_PASSWORD=...
SESSION_DRIVER=file
```

Database migrations are run during deployment.

8. Maintenance

Useful Laravel commands:

```
php artisan migrate
php artisan migrate:status
php artisan optimize:clear
php artisan route:list
```

After making code changes:

```
git add .
git commit -m "Describe the changes"
git push origin main
```

Railway will deploy the updated code from the GitHub repository.

9. Future Improvements

Possible future improvements include:

- Add admin authentication and authorization
- Add event capacity and ticket limits
- Add registration management for administrators
- Add email confirmation
- Add search and event filtering
- Improve production monitoring and logging

10. Repository

GitHub:

<https://github.com/ahmedwajid017-pixel/hivespace-event-portal>

11. Project Status

The core project requirements are complete. The application is deployed on Railway, the public event registration flow is working, and the admin event CRUD functionality has been tested successfully.
